

ECIP-1017

Intro

Bro, do you
even lift?

A Well-Trained Orchestra

in series Battle

The Numbers

Current

	Block Reward	Uncle Reward 1 (Max)	Uncle Reward 2 (Max)	Total (Max)
Block Miner	5	0.15625	0.15625	5.3125
Uncle Miner	0	4.375	4.375	8.75
Total	5	4.53125	4.53125	14.0625

- Continues in Perpetuity

- Per block range
 - Max = 14.0625 / block
 - Min = 5 / block

5M20

	Block Reward	Uncle Reward 1 (Max)	Uncle Reward 2 (Max)	Total (Max)
Block Miner	4	0.125	0.125	4.25
Uncle Miner	0	0.125	0.125	0.25
Total	4	0.25	0.25	4.5

- At block 5M
 - 20% reduction to all rewards
 - Equalize all uncle rewards
- At every additional 5M blocks
 - 20% reduction to all rewards
- Per block range, at block 5M
 - Max = 4.5 / block
 - Min = 4 / block

The chart displays two trends over time (from July 2015 to September 2023). The left Y-axis represents the 'Est. Annual Inflation Rate' as a percentage, ranging from 0.00% to 18.00%. The right Y-axis represents the 'Total ETC Supply' in millions, ranging from 0.00 to 900,000,000. The red line shows a sharp initial drop in inflation followed by a gradual decline. The blue line shows a steady, linear increase in total supply.

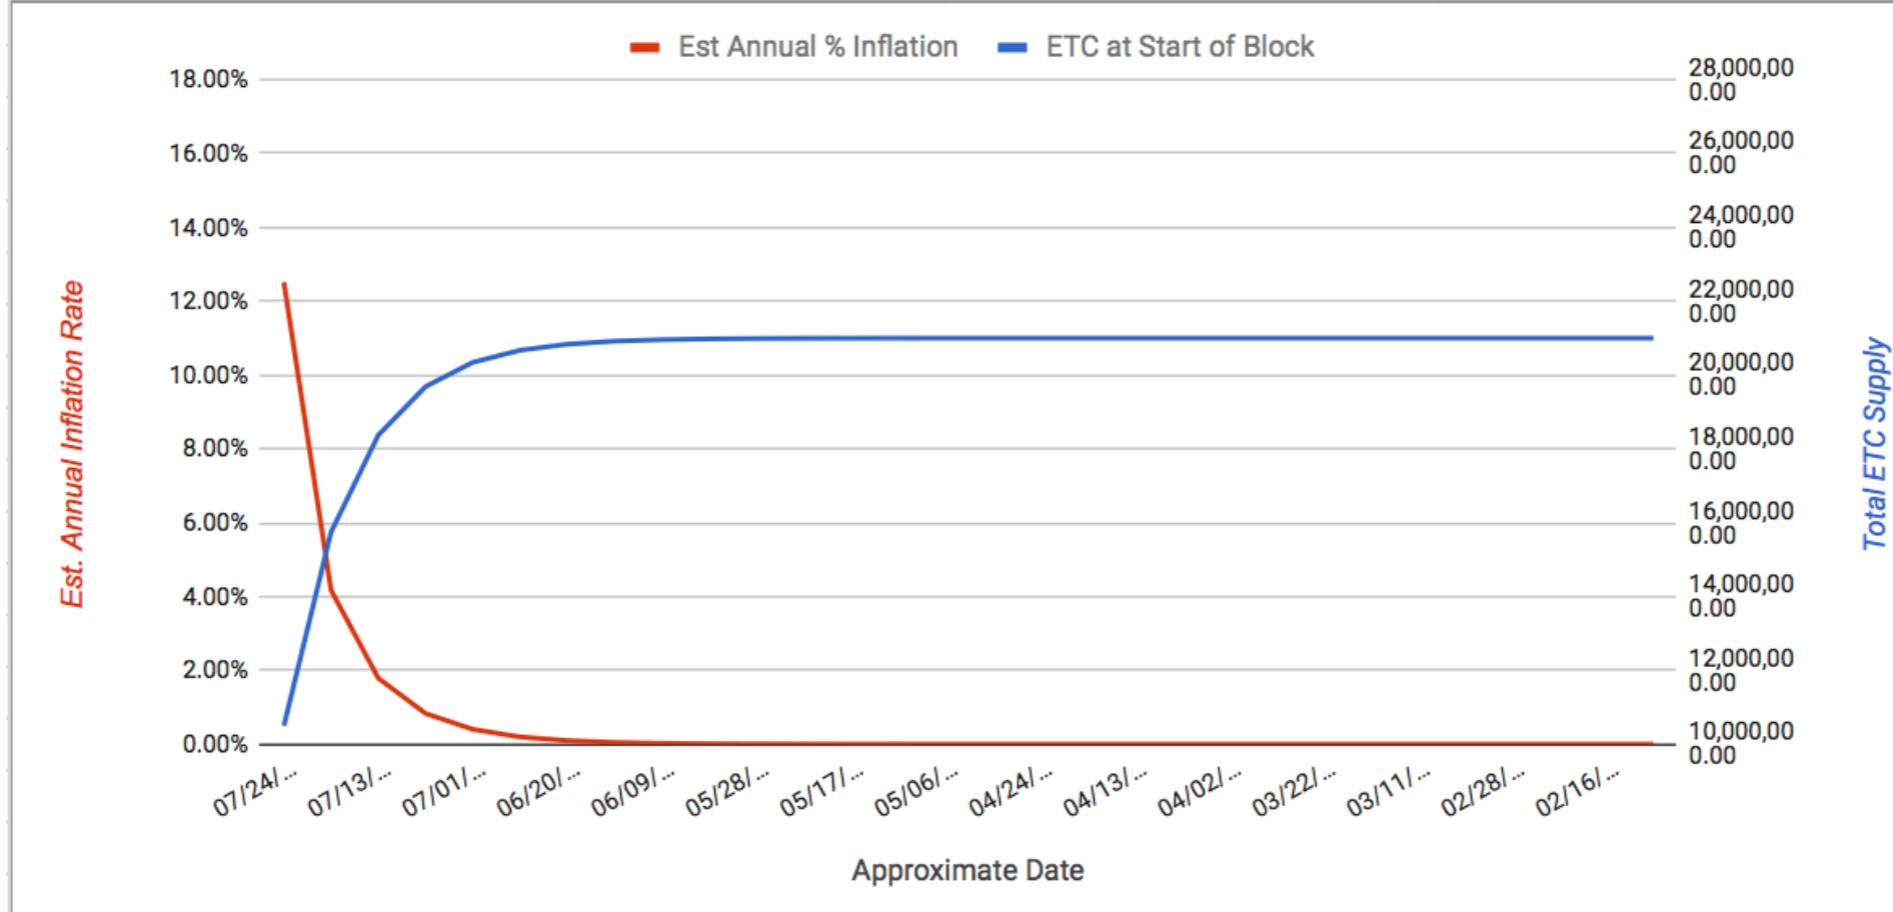

Approximate Date	Est. Annual % Inflation	Total ETC Supply (Millions)
07/30/2015	~15.5%	~150,000,000
09/23/2015	~10.0%	~160,000,000
01/01/2016	~8.0%	~170,000,000
06/01/2016	~5.0%	~180,000,000
01/01/2017	~3.5%	~190,000,000
01/01/2018	~2.5%	~200,000,000
01/01/2019	~2.0%	~210,000,000
01/01/2020	~1.8%	~220,000,000
01/01/2021	~1.5%	~230,000,000
01/01/2022	~1.3%	~240,000,000
01/01/2023	~1.1%	~250,000,000
09/23/2023	~1.5%	~900,000,000

The Reasoning

Why are the numbers the way they are?

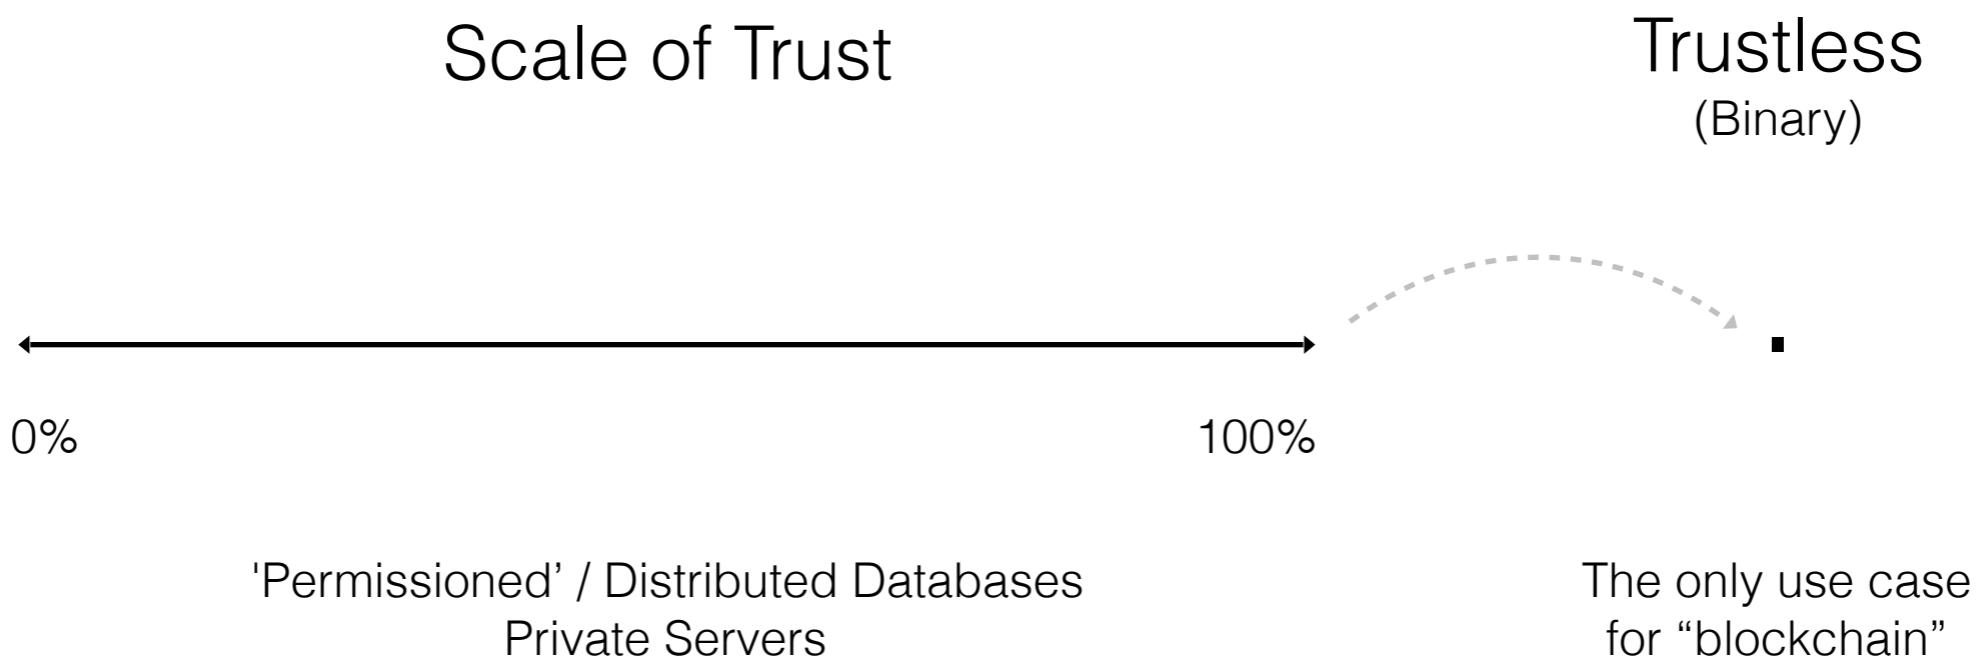

- Key point: they make the most trustworthy model
 - Is based on the most well known model in existence
 - The most trustworthy model will maximize investment potential from current and new sources b/c it minimizes skepticism.
- Rates used as metrics, not numbers
 - 50% emission
 - 3% inflation
- Simple to understand (5M20)
 - Complexity creates hesitation, slows progress, increases skepticism
 - Basically, reduces trust
 - No value is created in MP by introducing additional complexity
- Allows time for development and implementation, adoption, and awareness.
- “Optimum Total Investment”
 - This does not mean that this will necessarily raise the price or increase demand - it only minimizes/eliminates potential hesitation by those who are skeptical that this is a scam, or who don’t want to recalculate their financial and risk models.

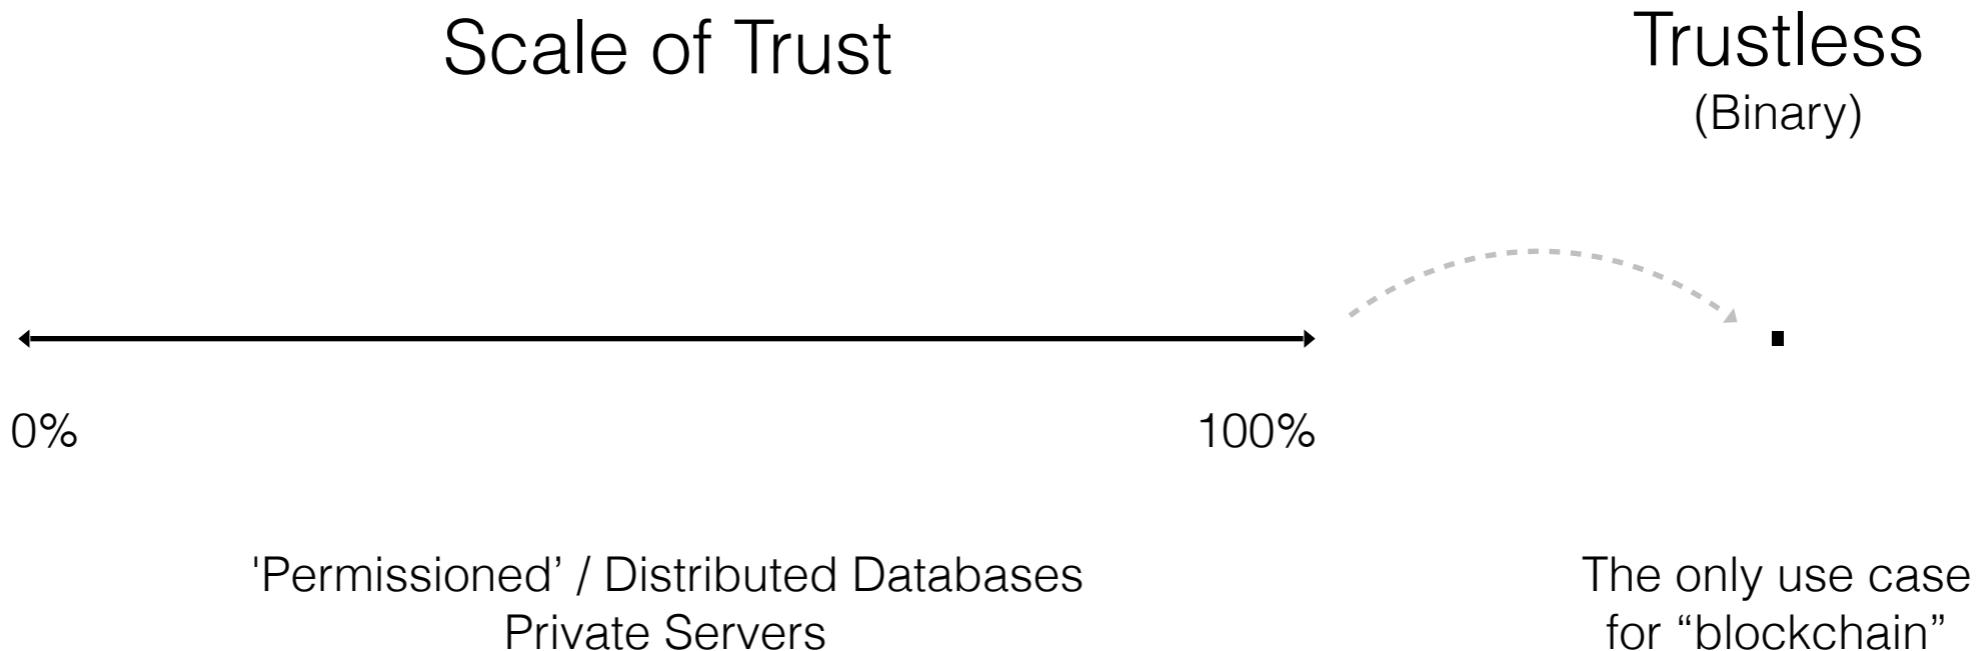

- A chain *can* move towards the right of the scale of trust and eventually make the jump to “Trustless”
 - This requires time and “tests” against the network
- However, the instant that a chain moves toward the left of the Scale, no matter how small of a movement:
 - It can never achieve a state of “Trustless”
 - It will be extremely difficult to move in the right direction again, becoming too costly to even continue
 - It will be “behind the power curve”
 - Extreme effort/resources will be required to move even a small distance to the right again.
 - Total collapse is an eventuality

- “Trustless” defined as (as it relates to blockchain transactions):
 - To an individual, when the probability that a future transaction he will execute on a blockchain will be reversed at some point reaches zero.
 - This is the same as the required level of consideration and belief required that $2+2=4$ or that gravity will affect the apple you drop from your hand. They don’t require any consideration. Your belief, and users collective beliefs in it is irrelevant to its operation, it just is, given that the incentive structure is such that

- Blockchains suck
 - The most extreme example of inefficiency
 - Saving data not on one computer, but on every computer
 - Maximizes repeat data, storage costs, computing costs, electricity costs etc.
 - Very slow
 - Data takes minutes to hours, sometime days, to be hashed into a block.
 - Limited information
 - Competition for block propagation and mining reward incentivizes smaller amounts of data
 - Fully burdened costs paid for by user base
 - The ONLY redeeming feature is that what's goes on that ledger stays on that ledger

- Plausible strategies by those on ETH to attempt to mitigate effects of fork
 - Retain Relevance
 - Increased discussion and efforts on core protocol
 - Because core value case is shot
 - Introduce more variables to prop up perceived value
 - Greater promises with longer times to completion
 - Prolong hope
 - Hope that time heals
 - Works in many cases
 - But not in situations high consequence
 - Will remain as ETH's Scarlet Letter

Trust is the most valuable asset on the planet

Familiarity and Consistency of markers of Trust

- Trust has value
- Familiarity and Consistency is trust
- The model with the most trust is the most valuable
 - Reduces skepticism, friction
- The model that is the most familiar is bitcoin's

Numbers don't matter, distribution rate does

- The rate of distribution determines the opportunity to get involved
 - Bitcoin has set the precedent for optimal level of time for adoption windows

ETH had a pre-mine of about 72M

- ETC is stuck with that
- Bitcoin did not have a premine
 - Adopting bitcoin's 210k/50% blocks model risks token concentration/increases skepticism

ETC 4yr/50% Reduction

occurred

Solution: Simple, relevant metrics to measure against:

- Time to 50% distribution
 - Time frame in which the most concentration of token ownership likely occurs
 - Centralization risk
- Time to 3% inflation
 - Long term traditional financial risk free rate

Sooner by 10 months?!??!

However “risk” period began in Sept 2014, after pre-sale

=

Dates are off by one month

Uncle Adjustment

- Current uncle rewards are structured so that they incentivize coercion and centralization
 - More reward for having uncles included than total reward
 - “Uncle Farming”
- Equalize all uncle values
 - Rewards to uncle miners is the same as the reward to the block miner who includes them
 - 1/32 of block reward

Current Uncle Rewards (Era 1)

	ETC Reward	Value	Ratio
Block Reward	5	0.15625	1/32
Uncle Miner (1 block back)		4.375	7/8
Uncle Miner (2 block back)		3.750	3/4
Uncle Miner (3 block back)		3.125	5/8
Uncle Miner (4 block back)		2.500	1/2
Uncle Miner (5 block back)		1.875	3/8
Uncle Miner (6 block back)		1.250	1/4
Uncle Miner (7 block back)		0.625	1/8

5M20 Uncle Rewards (Era 2)

	ETC Reward	Value	Ratio
Block Reward	4	0.125	1/32
Uncle Miner (1 block back)		0.125	1/32
Uncle Miner (2 block back)		0.125	1/32
Uncle Miner (3 block back)		0.125	1/32
Uncle Miner (4 block back)		0.125	1/32
Uncle Miner (5 block back)		0.125	1/32
Uncle Miner (6 block back)		0.125	1/32
Uncle Miner (7 block back)		0.125	1/32

Bitcoin Bitcoin Bitcoin, *blah, blah, blah...*

'This is supposed to be about ETC'

By removing this variable (MP), 1017 positions ETC to prove its utility and to maximize its impact if/when true utility value is created

The only way a crypto can survive is by adopting the very best ideas and options.
Anything sub-optimal means chain split and one chain dies

If Crypto is disruptive enough, it does not need to rely on any fancy monetary policy to survive. Bitcoin has already solved the incentive structure issue.
